**DETAILED ACTION**

***Election/Restrictions***

1. Restriction to one of the following inventions is required under 35 U.S.C. 121:
  - I. Claims 1, 2, 4, and 6 - 8 drawn to a time slot interchange circuit and method of its implementation, classified in class 370, subclass 376.
  - II. Claims 10 - 23, drawn to a telephony signaling circuit, classified in class 713, subclass 322.
2. The inventions are distinct, each from the other because of the following reasons:

Inventions I and II are related as subcombinations disclosed as usable together in a single combination with respect to the interchange circuit (claims 1, 2, 4), and process and apparatus with respect to the method (claims 6 – 8).

The subcombinations are distinct from each other if they are shown to be separately usable. In the instant case, invention III has separate utility such as saving memory and power consumption in the digital signal processor of a wide variety of devices aside from a time slot interchange circuit, such as, for example, a voltage regulator, a memory device, or a phase locked loop. See MPEP § 806.05(d).

The process and apparatus inventions are distinct if it can be shown that either: (1) the process as claimed can be practiced by another materially different apparatus or by hand, or (2) the apparatus as claimed can be used to practice another and materially different process. (MPEP § 806.05(e)). In this case the apparatus claimed in claim 10 is used to compare bits in a data sequence through the use of a comparator, and perform substitution if the bits of the first signal differ from the second signal bits.

Because these inventions are distinct for the reasons given above and have acquired a separate status in the art as shown by their different classification, restriction for examination purposes as indicated is proper.

Applicant is advised that the reply to this requirement to be complete must include an election of the invention to be examined even though the requirement be traversed (37 CFR 1.143).
